(54) Title: **SUBSTITUTED QUINAZOLINE DERIVATIVES AND THEIR USE AS INHIBITORS**(57) Abstract: The use of a compound of formula (I) or a salt, ester or amide thereof; where X is O, or S, S(O) or S(O)<sub>2</sub>, or NR<sup>6</sup> where R<sup>6</sup> is hydrogen or C<sub>1-6</sub>alkyl; R<sup>5</sup> is an optionally substituted 5-membered heteroaromatic ring, R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup> are independently selected from various specified moieties, in the preparation of a medicament for use in the inhibition of aurora 2 kinase. Certain compounds are novel and these, together with pharmaceutical compositions containing them are also described and claimed.

## SUBSTITUTED QUINAZOLINE DERIVATES AND THEIR USE AS INHIBITORS

The present invention relates to certain quinazoline derivatives for use in the treatment of certain diseases in particular to proliferative disease such as cancer and in the preparation of medicaments for use in the treatment of proliferative disease, to novel quinazoline compounds and to processes for their preparation, as well as pharmaceutical compositions containing them as active ingredient.

Cancer (and other hyperproliferative disease) is characterised by uncontrolled cellular proliferation. This loss of the normal regulation of cell proliferation often appears to occur as the result of genetic damage to cellular pathways that control progress through the cell cycle.

In eukaryotes, the cell cycle is largely controlled by an ordered cascade of protein phosphorylation. Several families of protein kinases that play critical roles in this cascade have now been identified. The activity of many of these kinases is increased in human tumours when compared to normal tissue. This can occur by either increased levels of expression of the protein (as a result of gene amplification for example), or by changes in expression of co activators or inhibitory proteins.

The first identified, and most widely studied of these cell cycle regulators have been the cyclin dependent kinases (or CDKs). Activity of specific CDKs at specific times is essential for both initiation and coordinated progress through the cell cycle. For example, the CDK4 protein appears to control entry into the cell cycle (the G0-G1-S transition) by phosphorylating the retinoblastoma gene product pRb. This stimulates the release of the transcription factor E2F from pRb, which then acts to increase the transcription of genes necessary for entry into S phase. The catalytic activity of CDK4 is stimulated by binding to a partner protein, Cyclin D. One of the first demonstrations of a direct link between cancer and the cell cycle was made with the observation that the Cyclin D1 gene was amplified and cyclin D protein levels increased (and hence the activity of CDK4 increased) in many human tumours (Reviewed in Sherr, 1996, Science 274: 1672-1677; Pines, 1995, Seminars in Cancer Biology 6: 63-72). Other studies (Loda et al., 1997, Nature Medicine 3(2): 231-234; Gemma et al., 1996, International Journal of Cancer 68(5): 605-11; Elledge et al. 1996, Trends in Cell Biology 6: 388-392) have shown that negative regulators of CDK function are frequently down regulated or deleted in human tumours again leading to inappropriate activation of these kinases.

-2-

More recently, protein kinases that are structurally distinct from the CDK family have been identified which play critical roles in regulating the cell cycle and which also appear to be important in oncogenesis. These include the newly identified human homologues of the *Drosophila* aurora and *S.cerevisiae* Ipl1 proteins. *Drosophila* aurora and *S.cerevisiae* Ipl1, which are highly homologous at the amino acid sequence level, encode serine/threonine protein kinases. Both aurora and Ipl1 are known to be involved in controlling the transition from the G2 phase of the cell cycle through mitosis, centrosome function, formation of a mitotic spindle and proper chromosome separation / segregation into daughter cells. The two human homologues of these genes, termed aurora1 and aurora2, encode cell cycle regulated protein kinases. These show a peak of expression and kinase activity at the G2/M boundary (aurora2) and in mitosis itself (aurora1). Several observations implicate the involvement of human aurora proteins, and particularly aurora2 in cancer. The aurora2 gene maps to chromosome 20q13, a region that is frequently amplified in human tumours including both breast and colon tumours. Aurora2 may be the major target gene of this amplicon, since aurora2 DNA is amplified and aurora2 mRNA overexpressed in greater than 50% of primary human colorectal cancers. In these tumours aurora2 protein levels appear greatly elevated compared to adjacent normal tissue. In addition, transfection of rodent fibroblasts with human aurora2 leads to transformation, conferring the ability to grow in soft agar and form tumours in nude mice (Bischoff et al., 1998, The EMBO Journal. 17(11): 3052-3065). Other work (Zhou et al., 1998, Nature Genetics. 20(2): 189-93) has shown that artificial overexpression of aurora2 leads to an increase in centrosome number and an increase in aneuploidy.

Importantly, it has also been demonstrated that abrogation of aurora2 expression and function by antisense oligonucleotide treatment of human tumour cell lines (WO 97/22702 and WO 99/37788) leads to cell cycle arrest in the G2 phase of the cell cycle and exerts an antiproliferative effect in these tumour cell lines. This indicates that inhibition of the function of aurora2 will have an antiproliferative effect that may be useful in the treatment of human tumours and other hyperproliferative diseases.

A number of quinazoline derivatives have been proposed hitherto for use in the inhibition of various kinases. Examples of such proposals are included in WO 92/20642 and EP-B-584222 which relates to bicyclic compounds which inhibit epidermal growth factor (EGF) and platelet-derived growth factor (PDGF) receptor tyrosine kinase, WO 95/15758 which describes the use of bis ring systems for the selective inhibition of CSF-1R tyrosine

-3-

kinase activity, and WO 99/09016, WO 97/03069 and US 570158 which describe the use of certain quinazoline compounds as tyrosine kinase inhibitors in other contexts.

The applicants have found a series of compounds which inhibit the effect of the aurora2 kinase and which are thus of use in the treatment of proliferative disease such as cancer, in particular in such diseases such as colorectal or breast cancer where aurora 2 kinase is known to be active.

The present invention provides the use of a compound of formula (I)

- in the preparation of a medicament for use in the inhibition of aurora 2 kinase. In particular, such medicaments are useful in the treatment of proliferative disease such as cancer, and in particular cancers where aurora 2 is upregulated such as colon or breast cancers.
- 15 In this specification the term 'alkyl' when used either alone or as a suffix includes straight chained, branched structures. Unless otherwise stated, these groups may contain up to 10, preferably up to 6 and more preferably up to 4 carbon atoms. Similarly the terms "alkenyl" and "alkynyl" refer to unsaturated straight or branched structures containing for example from 2 to 10, preferably from 2 to 6 carbon atoms. Cyclic moieties such as cycloalkyl, cycloalkenyl and cycloalkynyl are similar in nature but have at least 3 carbon atoms. Terms such as "alkoxy" comprise alkyl groups as is understood in the art.

The term "halo" includes fluoro, chloro, bromo and iodo. References to aryl groups include aromatic carbocyclic groups such as phenyl and naphthyl. The term "heterocyclyl" includes aromatic or non-aromatic rings, for example containing from 4 to 20, suitably from 5 to 8 ring atoms, at least one of which is a heteroatom such as oxygen, sulphur or nitrogen. Examples of such groups include furyl, thienyl, pyrrolyl, pyrrolidinyl, imidazolyl, triazolyl, thiazolyl, tetrazolyl, oxazolyl, isoxazolyl, pyrazolyl, pyridyl, pyrimidinyl, pyrazinyl, pyridazinyl, triazinyl, quinolinyl, isoquinolinyl, quinoxalinyl, benzothiazolyl, benzoxazolyl, benzothienyl or benzofuryl.

30 "Heteroaryl" refers to those groups described above which have an aromatic character. The term "aralkyl" refers to aryl substituted alkyl groups such as benzyl.

Other expressions used in the specification include "hydrocarbonyl" which refers to any structure comprising carbon and hydrogen atoms. For example, these may be alkyl, alkenyl, alkynyl, aryl, heterocyclyl, alkoxy, aralkyl, cycloalkyl, cycloalkenyl or cycloalkynyl.

The term "functional group" refers to reactive substituents such as nitro, cyano, halo, oxo,  $=CR^{78}R^{79}$ ,  $C(O)_xR^{77}$ ,  $OR^{77}$ ,  $S(O)_yR^{77}$ ,  $NR^{78}R^{79}$ ,  $C(O)NR^{78}R^{79}$ ,  $OC(O)NR^{78}R^{79}$ ,  $=NOR^{77}$ ,  $-NR^{77}C(O)_xR^{78}$ ,  $-NR^{77}CONR^{78}R^{79}$ ,  $-N=CR^{78}R^{79}$ ,  $S(O)_yNR^{78}R^{79}$  or  $-NR^{77}S(O)_yR^{78}$  where  $R^{77}$ ,  $R^{78}$  and  $R^{79}$  are independently selected from hydrogen or optionally substituted hydrocarbonyl, or  $R^{78}$  and  $R^{79}$  together form an optionally substituted ring which optionally contains further heteroatoms such as S(O)<sub>y</sub> oxygen and nitrogen, x is an integer of 1 or 2, y is 0 or an integer of 1-3.

Suitable optional substituents for hydrocarbonyl groups  $R^{77}$ ,  $R^{78}$  and  $R^{79}$  include halo, perhaloalkyl such as trifluoromethyl, mercapto, hydroxy, carboxy, alkoxy, aryl, heteroaryl, heteroaryloxy, alkenyloxy, alkynyloxy, alkoxyalkoxy, aryloxy (where the aryl group may be substituted by halo, nitro, or hydroxy), cyano, nitro, amino, mono- or di-alkyl amino, oximino or S(O)<sub>y</sub>, where y is as defined above.

Preferably  $R^4$  is hydrogen.

Suitably  $R^1$  is hydrogen or a group set out for  $R^2$  or  $R^3$  below. Frequently,  $R^1$  is hydrogen.

In a preferred embodiment, at least one group  $R^1$ ,  $R^2$  or  $R^3$ , preferably  $R^3$ , comprises a chain of at least 3 and preferably at least 4 optionally substituted carbon atoms or heteroatoms such as oxygen, nitrogen or sulphur. Most preferably the chain is substituted by a polar group which assists in solubility.

Suitably  $R^3$  is a group  $X^1R^9$ . Preferably in this case,  $X^1$  is oxygen and  $R^9$  is selected from a group of formula (1) or (10) above. Particular groups  $R^9$  are those in group (1) above, especially alkyl such as methyl or halo substituted alkyl, or those in group (10) above. In one preferred embodiment, at least one of  $R^2$  or  $R^3$  is a group  $-OC_{1-5}alkylR^{33}$  and  $R^{33}$  is a heterocyclic ring such as an N-linked morpholine ring such as 3-morpholinopropoxy.

Suitably  $R^2$  is selected from, halo, cyano, nitro, trifluoromethyl,  $C_{1-3}alkyl$ ,  $-NR^9R^{10}$  (wherein  $R^9$  and  $R^{10}$ , which may be the same or different, each represents hydrogen or  $C_{1-3}alkyl$ ), or a group  $-X^1R^{11}$ . Preferred examples of  $-X^1R^{11}$  for  $R^2$  include those listed above in relation to  $R^3$ .

Other examples for  $R^2$  and  $R^3$  include methoxy or 3,3,3-trifluoroethoxy.

-7-

Preferably X is NH or O and is most preferably NH.

Examples of 5-membered aromatic rings  $R^5$  include rings containing one or more heteroatoms selected from sulphur, oxygen and nitrogen. Such rings include pyrrole, pyrazole, pyrazolone, imidazole, oxazole, furan, tetrazole, triazole, thiazole, thiophene, or thiadiazole, any of which may be optionally substituted. In particular,  $R^5$  includes at least one nitrogen or sulphur heteroatoms. Preferred rings for  $R^5$  include pyrrole, pyrazole, imidazole, triazole, thiazole, thiophene, or thiadiazole.

In a particular embodiment,  $R^5$  is a sulphur containing ring. Suitably  $R^5$  is optionally substituted thiazole, optionally substituted thiophene or optionally substituted thiadiazole and preferably, optionally substituted thiazole or optionally substituted thiophene.

More preferably,  $R^5$  is a substituted thiazole or substituted thiophene group.

In particular,  $R^5$  is a group of formula (a), (b), (c) or (d) and preferably (a) or (b):

(a)

(b)

(c)

(d)

(e)

where  $R^{60}$ ,  $R^{61}$  and  $R^{62}$  are independently selected from hydrogen or a substituent group and \* indicates the point of attachment to the group X in formula (I). In particular, one of  $R^{60}$ ,  $R^{61}$  or  $R^{62}$  is a substituent group and the others are either hydrogen or a small substituent such as  $C_{1-3}$  alkyl, for instance methyl. Suitably  $R^{62}$  is hydrogen. Preferably  $R^{61}$  is other than hydrogen,

Alternatively,  $R^5$  is an optionally substituted nitrogen containing ring such as a group of formula (f), (g), (h), (i) or (j):

-8-

Suitable substituents for groups  $R^5$  include optionally substituted hydrocarbyl, optionally substituted heterocylyl or a functional group as defined above.

In particular,  $R^{60}$ ,  $R^{61}$  or  $R^{62}$  is a group of sub-formula (k)

5

(k)

where p and q are independently 0 or 1 and wherein  $R_1'$  and  $R_1''$  are independently hydrogen, hydroxy, optionally substituted alkyl, optionally substituted cycloalkyl, halogen, cyano, optionally substituted alkyl, optionally substituted alkyenyl. The optionally substituted alkyl or alkynyl may be substituted with halo, nitro, cyano, hydroxy, trifluoromethyl, amino, carboxy, carbamoyl, mercapto, sulfamoyl,  $C_{1-4}$  alkyl,  $C_{2-4}$  alkenyl,  $C_{2-4}$  alkynyl,  $C_{3-6}$  cycloalkyl,  $C_{3-6}$  cycloalkenyl,  $C_{1-4}$  alkoxy,  $C_{1-4}$  alkanoyl,  $C_{1-4}$  alkanoyloxy, N-( $C_{1-4}$  alkyl), N( $C_{1-4}$  alkyl)<sub>2</sub>,  $C_{1-4}$  alkanoylamino, ( $C_{1-4}$  alkanoyl)<sub>2</sub>amino, N-( $C_{1-4}$  alkyl)carbamoyl, N,N-( $C_{1-4}$ )<sub>2</sub>carbamoyl,  $C_{1-4}$ S,  $C_{1-4}$ S(O), ( $C_{1-4}$ alkyl)S(O)<sub>2</sub>, ( $C_{1-4}$ ) alkoxycarbonyl, N-( $C_{1-4}$  alkyl)sulfamoyl, N,N- $C_{1-4}$  alkyl)sulfamoyl,  $C_{1-4}$  alkylsolfonylamino, or heterocyclyl. R is preferably  $C_{1-4}$  alkyl,  $C_{2-4}$  alkenyl, or  $C_{2-4}$  alkynyl, and  $R_1'$  can form with  $R_1''$  a 3 to 6 membered ring.

T is C=O, SO<sub>n</sub>, C(=NOR)CO, C(O)C(O), C=NCN, CV=NO or wherein n = 0, 1 or 2 and V is independently  $R^{63}$  or N( $R^{63}$ ) $R^{64}$  wherein  $R^{63}$  and  $R^{64}$  are independently selected

from hydrogen, optionally substituted hydrocarbyl or optionally substituted heterocyclyl, or  $R^{63}$  and  $R^{64}$  together with the nitrogen atom to which they are attached form an optionally substituted heterocyclic ring.

Examples of groups for  $R^{63}$  and  $R^{64}$  include the group  $-(CH_2)_qR^{70}$  where  $q$  and  $R^{70}$  are  
5 as defined below in relation to formula (II).

Suitably one of  $R^{63}$  or  $R^{64}$  is hydrogen, or methyl, ethyl or propyl optionally substituted with hydroxy and preferably one of  $R^{63}$  or  $R^{64}$  is hydrogen. In this case, the other is suitably a larger substituent for example of at least 4 carbon or heteroatoms, and is optionally substituted hydrocarbyl or optionally substituted heterocyclyl. Particular optionally  
10 substituted hydrocarbyl groups for  $R^{63}$  or  $R^{64}$  include alkyl, cycloalkyl, alkenyl, or aryl any of which is optionally substituted with a functional group as defined above, or in the case of aryl groups, with an alkyl group and in the case of alkyl group, with an aryl or heterocyclic group either of which may themselves be optionally substituted with alkyl or a functional group.

Examples of optionally substituted aryl groups  $R^{63}$  or  $R^{64}$  include phenyl optionally  
15 substituted with one or more groups selected from  $C_{1-6}$  alkyl group such as methyl or ethyl (either of which may be optionally substituted with a functional group such as hydroxy), or a functional group as defined above (such as halo like fluoro, chloro or bromo, hydroxy, alkoxy such as methoxy, trifluoromethyl, nitro, cyano, trifluoromethoxy,  $CONH_2$ ,  $C(O)CH_3$ , amino, or dimethylamino).

20 When  $R^{63}$  or  $R^{64}$  is an optionally substituted alkyl group, it is suitably a  $C_{1-6}$ alkyl group, optionally substituted with one or more functional groups (such as cyano, hydroxy, alkoxy, in particular methoxy, COOalkyl such as  $COOCH_3$ ), or aryl optionally substituted with a functional group as defined above (in particular in relation to  $R^{63}$  or  $R^{64}$  themselves, or an optionally substituted heterocyclic group such as N-methyl pyrrole.

25 When  $R^{63}$  and  $R^{64}$  is optionally substituted cycloalkyl, it is suitable cyclohexyl optionally substituted with a functional group such as hydroxy.

When  $R^{63}$  and  $R^{64}$  is optionally substituted alkenyl, it is suitably prop-2-enyl.

When  $R^{63}$  or  $R^{64}$  is optionally substituted heterocyclyl, or  $R^{63}$  and  $R^{64}$  together form a heterocyclic group, then this may be aromatic or non-aromatic and includes in particular,  
30 piperidine, piperazine, morpholino, pyrrolidine or pyridine any of which may be optionally substituted with a functional group such as hydroxy, alkoxy such as methoxy, or alkyl such as methyl which may itself be substituted with for instance a hydroxy group.

-10-

Alternatively at least one of  $R^{60}$ ,  $R^{61}$  or  $R^{62}$  is a functional group, and in particular, one of  $R^{60}$ ,  $R^{61}$  or  $R^{62}$  is a functional group a group of formula  $(CR_2)_pC(O)_xR^{77}$  where  $R$ ,  $p$ ,  $x$  and  $R^{77}$  are as defined above, and in particular  $x$  is 2 and  $R^{77}$  is hydrogen or alkyl such as methyl.

5 Alternatively,  $R^5$  is substituted by one or more groups selected from nitro, halo,  $C_1$ -alkyl, optionally substituted  $C_{1-6}$  alkoxy,  $C_{1-4}$ alkoxymethyl, di( $C_{1-4}$ alkoxy)methyl,  $C_{1-6}$ alkanoyl, trifluoromethyl, cyano, amino,  $C_{2-6}$ alkenyl,  $C_{2-6}$ alkynyl, a phenyl group, a benzyl group or a 5-6-membered heterocyclic group with 1-3 heteroatoms, selected independently from O, S and N, which heterocyclic group may be aromatic or non-aromatic and may be  
 10 saturated (linked via a ring carbon or nitrogen atom) or unsaturated (linked via a ring carbon atom), and which phenyl, benzyl or heterocyclic group may bear on one or more ring carbon atoms up to 5 substituents selected from hydroxy, halogeno,  $C_{1-3}$ alkyl,  $C_{1-3}$ alkoxy,  $C_{1-3}$ alkanoyloxy, trifluoromethyl, cyano, amino, nitro,  $C_{2-4}$ alkanoyl,  $C_{1-4}$ alkanoylamino,  $C_{1-4}$ alkoxycarbonyl,  $C_{1-4}$ alkylsulphanyl,  $C_{1-4}$ alkylsulphinyl,  $C_{1-4}$ alkylsulphonyl, carbamoyl, N- $C_{1-4}$ alkylcarbamoyl, N,N-di( $C_{1-4}$ alkyl)carbamoyl, aminosulphonyl, N- $C_{1-4}$ alkylaminosulphonyl, N,N-di( $C_{1-4}$ alkyl)aminosulphonyl,  $C_{1-4}$ alkylsulphonylamino, and a saturated heterocyclic group selected from morpholino, thiomorpholino, pyrrolidinyl, piperazinyl, piperidinyl imidazolidinyl and pyrazolidinyl, which saturated heterocyclic group may bear 1 or 2  
 20 substituents selected from oxo, hydroxy, halogeno,  $C_{1-3}$ alkyl,  $C_{1-3}$ alkoxy,  $C_{1-3}$ alkanoyloxy, trifluoromethyl, cyano, amino, nitro and  $C_{1-4}$ alkoxycarbonyl.

Suitably  $R^5$  is substituted with at least one group which has at least 4 atoms which may be carbon or heteroatoms forming a chain. A particular example of such a substituent is optionally substituted alkoxy or alkoxy methyl. Suitable substituents for the alkoxy group include those listed above in relation to  $R^{77}$ ,  $R^{78}$  and  $R^{79}$ .

25 A further particular substituent group for  $R^5$  is a group of sub-formula (II)

where  $p$  and  $q$  are independently 0 or 1, and  $r$  is 0, 1, 2, 3 or 4 and,  $R_1'$ ,  $R_1''$  and  $T$  are as  
 30 previously defined above;

$R^{70}$  is hydrogen, hydroxy (other than where  $q$  is 0),  $C_{1-6}$ alkyl,  $C_{1-6}$ alkoxy, amino,  $N$ - $C_{1-6}$ alkylamino,  $N,N$ -( $C_{1-6}$ alkyl)<sub>2</sub>amino, hydroxy $C_{2-6}$ alkoxy,  $C_{1-6}$ alkoxy $C_{2-6}$ alkoxy,

or any aryl, heteroaryl or heterocyclyl group in a R<sup>70</sup> group may be optionally substituted with one or more groups of the Formula (V):

-12-

wherein  $D^1$  is aryl, heteroaryl or heterocyclyl and  $E^1$  is a bond,  $C_{1-6}$ alkylene,  $oxyC_{1-6}$ alkylene, oxy, imino,  $N-(C_{1-6}alkyl)imino$ ,  $iminoC_{1-6}alkylene$ ,  $N-(C_{1-6}alkyl)-iminoC_{1-6}alkylene$ ,  $C_{1-6}alkylene-oxyC_{1-6}alkylene$ ,  $C_{1-6}alkylene-iminoC_{1-6}alkylene$ ,  $C_{1-6}alkylene-N-(C_{1-6}alkyl)-iminoC_{1-6}alkylene$ ,  $-NHC(O)-$ ,  $-NHSO_2-$ ,  $-SO_2NH-$  or  $-NHC(O)-C_{1-6}alkylene-$ , and any aryl, heteroaryl or heterocyclyl group in a substituent on  $D^1$  may be optionally substituted with one or more groups selected from hydroxy, halo,  $C_{1-6}alkyl$ ,  $C_{1-6}alkoxy$ , carboxy,  $C_{1-6}alkoxycarbonyl$ , carbamoyl,  $N-C_{1-6}alkylcarbamoyl$ ,  $N-(C_{1-6}alkyl)_2carbamoyl$ ,  $C_{2-6}alkanoyl$ , amino,  $N-C_{1-6}alkylamino$  and  $N,N-(C_{1-6}alkyl)_2amino$ , and any  $C_{3-7}cycloalkyl$  or heterocyclyl group in a  $R^{70}$  group may be optionally substituted with one or two oxo or thioxo substituents, and any of the  $R^{70}$  groups defined hereinbefore which comprises a  $CH_2$  group which is attached to 2 carbon atoms or a  $CH_3$  group which is attached to a carbon atom may optionally bear on each said  $CH_2$  or  $CH_3$  group a substituent selected from hydroxy, amino,  $C_{1-6}alkoxy$ ,  $N-C_{1-6}alkylamino$ ,  $N,N-(C_{1-6}alkyl)_2amino$  and heterocyclyl.

A preferred example of a substituent of formula (II) is a group where  $q$  is 0.

A particular example of a group  $R^{70}$  in formula (II) is phenyl.

Another preferred substituent group for  $R^5$  is a group of formula (VI)

(VI)

where  $R^{71}$  and  $R^{72}$  are independently selected from hydrogen or  $C_{1-4}alkyl$ , or  $R^{71}$  and  $R^{72}$  together form a bond, and  $R^{73}$  is a group  $OR^{74}$ ,  $NR^{75}R^{76}$  where  $R^{74}$ ,  $R^{75}$  and  $R^{76}$  are independently selected from optionally substituted hydrocarbyl or optionally substituted heterocyclic groups, and  $R^{75}$  and  $R^{76}$  may additionally form together with the nitrogen atom to which they are attached, an aromatic or non-aromatic heterocyclic ring which may contain further heteroatoms.

Suitable optional substituents for hydrocarbyl or heterocyclic groups  $R^{74}$ ,  $R^{75}$  and  $R^{76}$  include functional groups as defined above. Heterocyclic groups  $R^{74}$ ,  $R^{75}$  and  $R^{76}$  may further be substituted by hydrocarbyl groups.

-13-

In particular,  $R^{71}$  and  $R^{72}$  in sub-formula (VI) are hydrogen.

Particular examples of  $R^{73}$  are groups  $OR^{74}$  where  $R^{74}$  is  $C_{1-4}$ alkyl.

Further examples of  $R^{73}$  are groups of formula  $NR^{75}R^{76}$  where one of  $R^{75}$  or  $R^{76}$  is hydrogen and the other is optionally substituted  $C_{1-6}$ alkyl, optionally substituted aryl or  
5 optionally substituted heterocyclyl.

In particular, one of  $R^{75}$  or  $R^{76}$  is hydrogen and the other is  $C_{1-6}$ alkyl optionally substituted with trifluoromethyl,  $C_{1-3}$  alkoxy such as methoxy, cyano, thio $C_{1-4}$ alkyl such as methylthio, or heterocyclyl optionally substituted with hydrocarblyl, such as indane, furan optionally substituted with  $C_{1-4}$  alkyl such as methyl.

10 In another embodiment, one of  $R^{75}$  or  $R^{76}$  is hydrogen and the other is an optionally substituted heterocyclic group such as pyridine, or a phenyl group optionally substituted with for example one or more groups selected from halo, nitro, alkyl such as methyl, or alkoxy such as methoxy.

Suitable pharmaceutically acceptable salts of compounds of Formula (I) or Formula  
15 (IA) include acid addition salts such as methanesulfonate, fumarate, hydrochloride, hydrobromide, citrate, maleate and salts formed with phosphoric and sulphuric acid. There may be more than one cation or anion depending on the number of charged functions and the valency of the cations or anions. Where the compound of Formula (I) or Formula (IA) includes an acid functionality, salts may be base salts such as an alkali metal salt for example  
20 sodium, an alkaline earth metal salt for example calcium or magnesium, an organic amine salt for example triethylamine, morpholine, *N*-methylpiperidine, *N*-ethylpiperidine, procaine, dibenzylamine, *N,N*-dibenzylethylamine or amino acids for example lysine. A preferred pharmaceutically acceptable salt is a sodium salt.

An *in vivo* hydrolysable ester of a compound of the Formula (I) or Formula (IA)  
25 containing carboxy or hydroxy group is, for example, a pharmaceutically acceptable ester which is hydrolysed in the human or animal body to produce the parent acid or alcohol.

Suitable pharmaceutically acceptable esters for carboxy include  $C_{1-6}$ alkyl esters such as methyl or ethyl esters,  $C_{1-6}$ alkoxymethyl esters for example methoxymethyl,  $C_{1-6}$ alkanoyloxymethyl esters for example pivaloyloxymethyl, phthalidyl esters,  
30  $C_{3-8}$ cycloalkoxy-carbonyloxy $C_{1-6}$ alkyl esters for example 1-cyclohexylcarbonyloxyethyl; 1,3-dioxolen-2-onylmethyl esters for example 5-methyl-1,3-dioxolen-2-onylmethyl; and  $C_{1-6}$ alkoxycarbonyloxyethyl esters for example 1-methoxycarbonyloxyethyl and may be formed at any carboxy group in the compounds of this invention.

-14-

An *in vivo* hydrolysable ester of a compound of the Formula (I) or Formula (IA) containing a hydroxy group includes inorganic esters such as phosphate esters and  $\alpha$ -acyloxyalkyl ethers and related compounds which as a result of the *in vivo* hydrolysis of the ester breakdown to give the parent hydroxy group. Examples of  $\alpha$ -acyloxyalkyl ethers include  
5 acetoxymethoxy and 2,2-dimethylpropionyloxymethoxy. A selection of *in vivo* hydrolysable ester forming groups for hydroxy include alkanoyl, benzoyl, phenylacetyl and substituted benzoyl and phenylacetyl, alkoxycarbonyl (to give alkyl carbonate esters), dialkylcarbamoyl and *N*-(dialkylaminoethyl)-*N*-alkylcarbamoyl (to give carbamates), dialkylaminoacetyl and carboxyacetyl.

10 Suitable amides are derived from compounds of Formula (I) or Formula (IA) which have a carboxy group which is derivatised into an amide such as a *N*-C<sub>1-6</sub>alkyl and *N,N*-di-(C<sub>1-6</sub>alkyl)amide such as *N*-methyl, *N*-ethyl, *N*-propyl, *N,N*-dimethyl, *N*-ethyl-*N*-methyl or *N,N*-diethylamide.

Preferred compounds of Formula (I) or Formula (IA) are those that are stable in  
15 mouse, rat, or human serum, preferably those that are stable in human serum.

Esters which are not *in vivo* hydrolysable may be useful as intermediates in the production of the compounds of Formula (I) or Formula (IA).

Particular examples of compounds of Formula (I) or Formula (IA) are set out in Tables  
1 to 30 below.

Other compounds of Formula (I) or Formula (IA), in particular those in which R<sup>5</sup> carries a carboxy or carboxyl ester substituent are described below in the Examples.

Compounds of Formula (I) or Formula (IA) may be prepared by various methods which would be apparent from the literature. For example compounds of formula (I) where X is NH may be prepared by reacting a compound of formula (VII)

(VII)

-57-

where  $R^1$ ,  $R^2$ ,  $R^3$ , and  $R^4$  are as defined in relation to formula (I) and  $R^{85}$  is a group  $NR^{86}R^{87}$  where  $R^{86}$  and  $R^{87}$  are independently selected from alkyl such as methyl, with a compound of formula (VIII)

5

where  $R^{5'}$  is a group  $R^5$  as defined in relation to formula (I) or a precursor group thereof; and thereafter if desired or necessary, converting a precursor group  $R^{5'}$  to a group  $R^5$  and/or modifying substituents on the group  $R^5$ . The reaction is suitably effected in an organic solvent  
10 such as an acetic acid at elevated temperatures, conveniently at the reflux temperature of the solvent.

Examples of reactions in which a precursor group  $R^{5'}$  is converted to a group  $R^5$  and/or substituents on the group  $R^5$  are modified are standard chemical reactions, such as conversion of esters to acids, and thereafter, if required to the preferred amides. Examples of  
15 such reactions are provided hereinafter.

Compounds of formula (VII) are suitably prepared by reacting a compound of formula (IX)

(IX)

20

with an appropriate acetal such as N,N-dimethylformamide dimethyl acetal. The reaction is suitably effected in an organic solvent such as benzene, at elevated temperature, conveniently at the reflux temperature of the solvent.

Alternatively, compounds of formula (I) where X is NH may be prepared by  
25 rearranging a compound of formula (X)

-58-

(X)

where R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup> and R<sup>4</sup> are as defined in relation to formula (I) and R<sup>5'</sup> is as defined in  
 5 relation to formula (VIII) above, and thereafter if desired or necessary, converting a precursor  
 group R<sup>5'</sup> to a group R<sup>5</sup> and/or modifying substituents on the group R<sup>5</sup>, for example as  
 described generally above.

The rearrangement reaction is suitably effected in an organic solvent such as an alkyl  
 alcohol, in particular methanol, ethanol or cyclohexanol, acetic acid, or dimethylformamide,  
 10 using a strong base such as sodium hydroxide, sodium acetate, sodium methylate, or  
 dimethylamine. Elevated temperatures, for example of from 20°-120°C and preferably at  
 about 75°C are employed.

Compounds of formula (X) are suitably obtained by reacting a compound of formula  
 (XI)

15

(XI)

where R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup> and R<sup>4</sup> are as defined in relation to formula (I) and R<sup>86</sup> is an alkyl group such  
 20 as methyl; with a compound of formula (XII)

-59-

where  $R^{5'}$  is as defined in relation to formula (VIII). The reaction is suitably effected in an organic solvent such as methylene chloride, in the presence of a salt such as pyridinium hydrochloride. Moderate temperatures for example of from 0°-50°C and conveniently ambient temperature are employed.

5        Compounds of formula (XI) are suitably prepared by reacting a compound of formula (IX) as defined above, with a trialkylorthoformate such as trimethylorthoformate. The reaction is suitably effected at elevated temperature, for example of from 50°C to 120°C, and preferably at about 100°C, in the presence of a catalytic amount of an acid such as p-toluene sulphonic acid.

10       Compounds of formula (IX) are either known compounds or they can be prepared by conventional methods. In particular, compounds of formula (IX) may be prepared by reduction of the corresponding nitro compound of formula (XIII)

(XIII)

15

where R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup> and R<sup>4</sup> are as defined in relation to formula (I). Suitable reaction conditions are illustrated hereinafter.

Compounds of formula (XIII) may be obtained by nitration of a compound of formula (XIV)

(XIV)

20

-60-

for example, using nitric acid as the nitrating agent. Again, suitable reaction conditions are illustrated hereinafter.

The nitrile of formula (XIV) may be derived by reaction of the corresponding formamide with hydroxylamine as illustrated hereinafter.

5 Compounds of Formula (I) and Formula (IA) are inhibitors of aurora 2 kinase. As a result, these compounds can be used to treat disease mediated by these agents, in particular proliferative disease.

According to a further aspect of the present invention there is provided a method for inhibiting aurora 2 kinase in a warm blooded animal, such as man, in need of such treatment,  
10 which comprises administering to said animal an effective amount of a compound of Formula (I) or Formula (IA), or a pharmaceutically acceptable salt, or an *in vivo* hydrolysable ester thereof.

Certain compounds of formula (I) are novel and these form a further aspect of the invention. Thus the invention further comprises a compound of formula (IA)

15

(IA)

20 or a salt, ester or amide thereof;

where X is as defined in relation to formula (I);

R<sup>1'</sup>, R<sup>2'</sup>, R<sup>3'</sup>, R<sup>4'</sup> are equivalent to R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup> as defined in relation to formula (I) and R<sup>5a</sup> is an optionally substituted 5-membered heteroaromatic ring, subject to the following provisos:

(i) that where R<sup>5a</sup> is a pyrazole group, it carries a substituent of formula (k), (II) of (VI)

25 above,

(ii) that where X is NH and R<sup>5a</sup> is a substituted pyrazolone or tetrazolyl group, at least one of R<sup>1'</sup>, R<sup>2'</sup>, R<sup>3'</sup> and R<sup>4'</sup> is other than hydrogen; or

-61-

(iii) that where X is O and R<sup>5a</sup> is 1-methyl-4-nitro-1H-imidazol-5-yl, at least one of R<sup>1'</sup>, R<sup>2'</sup>, R<sup>3'</sup> and R<sup>4'</sup> is other than hydrogen.

Preferably at least one of R<sup>1'</sup>, R<sup>2'</sup>, R<sup>3'</sup> and R<sup>4'</sup> is other than hydrogen.

Suitably R<sup>5a</sup> is selected from the groups of sub-formulae (a)-(j) as set out above.

5 Preferably R<sup>5a</sup> is pyrrole, imidazole, triazole, thiazole, thiophene, or thiadiazole, any of which may be optionally substituted.

In particular, R<sup>5a</sup> is substituted by at least one group of formula (k), (II) of (VI) above.

Other preferred or particular groups and substituents in formula (IA) are as set out for the equivalent groups in formula (I) above.

10 According to a further aspect of the invention there is provided a compound of the formula (IA) as defined herein, or a pharmaceutically acceptable salt or an *in vivo* hydrolysable ester thereof, for use in a method of treatment of the human or animal body by therapy. In particular, the compounds are used in methods of treatment of proliferative disease such as cancer and in particular cancers such as colorectal or breast cancer where  
15 aurora 2 is upregulated.

The invention also provides a pharmaceutical composition comprising a compound of formula (IA) as defined herein, or a pharmaceutically acceptable salt, or an *in vivo* hydrolysable ester thereof, in combination with a pharmaceutically acceptable carrier.

Preferred or particular compounds of formula (IA) for use in the compositions of the  
20 invention are as described above in relation to preferred compounds of formula (I).

The compositions of the invention may be in a form suitable for oral use (for example as tablets, lozenges, hard or soft capsules, aqueous or oily suspensions, emulsions, dispersible powders or granules, syrups or elixirs), for topical use (for example as creams, ointments, gels, or aqueous or oily solutions or suspensions), for administration by inhalation (for  
25 example as a finely divided powder or a liquid aerosol), for administration by insufflation (for example as a finely divided powder) or for parenteral administration (for example as a sterile aqueous or oily solution for intravenous, subcutaneous, intramuscular or intramuscular dosing or as a suppository for rectal dosing).

The compositions of the invention may be obtained by conventional procedures using  
30 conventional pharmaceutical excipients, well known in the art. Thus, compositions intended for oral use may contain, for example, one or more colouring, sweetening, flavouring and/or preservative agents.

-62-

Suitable pharmaceutically acceptable excipients for a tablet formulation include, for example, inert diluents such as lactose, sodium carbonate, calcium phosphate or calcium carbonate, granulating and disintegrating agents such as corn starch or algenic acid; binding agents such as starch; lubricating agents such as magnesium stearate, stearic acid or talc; 5 preservative agents such as ethyl or propyl *p*-hydroxybenzoate, and anti-oxidants, such as ascorbic acid. Tablet formulations may be uncoated or coated either to modify their disintegration and the subsequent absorption of the active ingredient within the gastrointestinal track, or to improve their stability and/or appearance, in either case, using conventional coating agents and procedures well known in the art.

10 Compositions for oral use may be in the form of hard gelatin capsules in which the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules in which the active ingredient is mixed with water or an oil such as peanut oil, liquid paraffin, or olive oil.

Aqueous suspensions generally contain the active ingredient in finely powdered form 15 together with one or more suspending agents, such as sodium carboxymethylcellulose, methylcellulose, hydroxypropylmethylcellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia; dispersing or wetting agents such as lecithin or condensation products of an alkylene oxide with fatty acids (for example polyoxyethylene stearate), or condensation products of ethylene oxide with long chain aliphatic alcohols, for example 20 heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or 25 condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives (such as ethyl or propyl *p*-hydroxybenzoate, anti-oxidants (such as ascorbic acid), colouring agents, flavouring agents, and/or sweetening agents (such as sucrose, saccharine or aspartame).

30 Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil (such as arachis oil, olive oil, sesame oil or coconut oil) or in a mineral oil (such as liquid paraffin). The oily suspensions may also contain a thickening agent such as beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set out above, and flavouring agents

-63-

may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti-oxidant such as ascorbic acid.

Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water generally contain the active ingredient together with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients such as sweetening, flavouring and colouring agents, may also be present.

The pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, such as olive oil or arachis oil, or a mineral oil, such as for example liquid paraffin or a mixture of any of these. Suitable emulsifying agents may be, for example, naturally-occurring gums such as gum acacia or gum tragacanth, naturally-occurring phosphatides such as soya bean, lecithin, an esters or partial esters derived from fatty acids and hexitol anhydrides (for example sorbitan monooleate) and condensation products of the said partial esters with ethylene oxide such as polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening, flavouring and preservative agents.

Syrups and elixirs may be formulated with sweetening agents such as glycerol, propylene glycol, sorbitol, aspartame or sucrose, and may also contain a demulcent, preservative, flavouring and/or colouring agent.

The pharmaceutical compositions may also be in the form of a sterile injectable aqueous or oily suspension, which may be formulated according to known procedures using one or more of the appropriate dispersing or wetting agents and suspending agents, which have been mentioned above. A sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally-acceptable diluent or solvent, for example a solution in 1,3-butanediol.

Suppository formulations may be prepared by mixing the active ingredient with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Suitable excipients include, for example, cocoa butter and polyethylene glycols.

Topical formulations, such as creams, ointments, gels and aqueous or oily solutions or suspensions, may generally be obtained by formulating an active ingredient with a conventional, topically acceptable, vehicle or diluent using conventional procedure well known in the art.

Compositions for administration by insufflation may be in the form of a finely divided powder containing particles of average diameter of, for example, 30 $\mu$  or much less, the powder itself comprising either active ingredient alone or diluted with one or more physiologically acceptable carriers such as lactose. The powder for insufflation is then  
5 conveniently retained in a capsule containing, for example, 1 to 50mg of active ingredient for use with a turbo-inhaler device, such as is used for insufflation of the known agent sodium cromoglycate.

Compositions for administration by inhalation may be in the form of a conventional pressurised aerosol arranged to dispense the active ingredient either as an aerosol containing  
10 finely divided solid or liquid droplets. Conventional aerosol propellants such as volatile fluorinated hydrocarbons or hydrocarbons may be used and the aerosol device is conveniently arranged to dispense a metered quantity of active ingredient.

15 Board), Pergamon Press 1990.

The amount of active ingredient that is combined with one or more excipients to produce a single dosage form will necessarily vary depending upon the host treated and the particular route of administration. For example, a formulation intended for oral administration to humans will generally contain, for example, from 0.5 mg to 2 g of active agent  
20 compounded with an appropriate and convenient amount of excipients which may vary from about 5 to about 98 percent by weight of the total composition. Dosage unit forms will generally contain about 1 mg to about 500 mg of an active ingredient. For further information on Routes of Administration and Dosage Regimes the reader is referred to Chapter 25.3 in Volume 5 of Comprehensive Medicinal Chemistry (Corwin Hansch; Chairman of Editorial  
25 Board), Pergamon Press 1990.

The size of the dose for therapeutic or prophylactic purposes of a compound of the Formula I will naturally vary according to the nature and severity of the conditions, the age and sex of the animal or patient and the route of administration, according to well known principles of medicine. As mentioned above, compounds of the Formula I are useful in  
30 treating diseases or medical conditions which are due alone or in part to the effects of aurora 2 kinase.

-65-

In using a compound of the Formula I for therapeutic or prophylactic purposes it will generally be administered so that a daily dose in the range, for example, 0.5 mg to 75 mg per kg body weight is received, given if required in divided doses. In general lower doses will be administered when a parenteral route is employed. Thus, for example, for intravenous administration, a dose in the range, for example, 0.5 mg to 30 mg per kg body weight will generally be used. Similarly, for administration by inhalation, a dose in the range, for example, 0.5 mg to 25 mg per kg body weight will be used. Oral administration is however preferred.

A further aspect of the invention comprises a compound of Formula (I) or Formula (IA) as defined above, or a pharmaceutically acceptable salt or in vivo hydrolysable ester thereof, for use in the preparation of a medicament for the treatment of proliferative disease. Preferred compounds of Formula (I) or Formula (IA) for this purpose are as described above.

The following Examples illustrate the invention.

#### 15 General Scheme 1

#### Compound B

The amino nitrile A (534 mg, 3 mmol) in benzene (15 ml) was reacted with N,N-dimethylformamide dimethyl acetal (535 mg, 4.5 mmol) at 90°C, in a Dean Stark equipped flask. After 4.5 hours reflux, the solution was concentrated, and the residual oil triturated with ether to give the title compound as a solid (680 mg, 90 %).

##### 5 **Compound 200**

A mixture of amidine **B** (1.4 g, 6 mmol), ethyl 2-amino-4-thiazoleacetate (1.4 g, 7.5 mmol) in acetic acid (14 ml) was heated at 130°C for 3 hours. The solvent was removed under vacuum, the residue was triturated in ethanol (5 ml) and a solution of  $\text{NaHCO}_3$  (pH 8) for 10 minutes. The solid was recovered by filtration, washed with water, dissolved in  $\text{CH}_2\text{Cl}_2$ , and dried over  
10  $\text{MgSO}_4$ .  $\text{CH}_2\text{Cl}_2$  was evaporated, the residual oil treated with ether and pet. ether to give title compound (1.8 g, 80 %).

##### 15 **Compound 201**

Ester 200 (1.8 g, 4.8 mmol) was reacted with 2N NaOH (4.8 ml, 9.6 mmol) in ethanol (20 ml) at room temperature for 2 hours. The mixture was cooled to room temperature, acidified with EtOH, HCl (2N) to pH 3. Stirring was carried on for 15 minutes, and a yellow solid of title compound was recovered by filtration (1.7 g, 100 %).

##### **Synthesis of amide 5, general procedure**

The acid **201** (86.5 mg, 0.25 mmol) in DMF (1 ml) was reacted with various amines (2.6  
25 mmol) in presence of O-(7-azabenzotriazol-1-yl) N,N,N',N'-tetramethyluronium hexafluorophosphate (98 mg, 0.26 mmol), DIEA (33 mg, 0.26 mmol) at room temperature for 0.5 hour. A solution of  $\text{NaHCO}_3$  (1 ml) and water (7 ml) was added to the mixture. The mixture was left overnight, and the precipitated solid was then recovered by filtration, washed with water and dried under vacuum in presence of  $\text{P}_2\text{O}_5$ , to give compounds of formula **C** as  
30 listed below.

**Example 1.**

Using the reaction described in the General Scheme 1, starting with 4-aminomethyl pyridine (27 mg, 0.25 mmol) yielded Compound No. 1 in Table 1 (50 mg, 46 %).

The solid was filtered, washed with water, ethanol, ether, and dried under vacuum, to give title compounds. For the compounds which did not precipitate, the solution was concentrated to dryness, the residues were washed with methylene chloride, methanol, filtered. Alumine was added to the methylene chloride / methanol solution, and the solvent was evaporated. Purification of the compounds was carried out by chromatography over alumine, eluent CH<sub>2</sub>Cl<sub>2</sub> / MeOH : 98/2 to 95/5, to give title compounds.

4-((2-amino-1,3-thiazole-5-yl)acetic acid)-6-methoxy-7-(3-(N-methylpiperazinylpropoxy)

15 quinazoline

4-(methyl(2-amino-1,3-thiazole-5-yl)acetate)-6-methoxy-7-(3-(N-methylpiperazinylpropoxy) quinazoline (8.25 g, 17 mmol) in ethanol (80 ml) was treated with sodium hydroxyde (2N, 42.5 ml, 85 mmol) at room temperature for 1 hour. Hydrochloride acid (2N) was added to the solution (pH 3). The solution was evaporated, the residue dissolved in ethanol and N-ethyl  
20 diisopropyl amine (8.9 ml, 51 mmol). Ether was added to the solution, the solid was recovered, dried to give title compound (7.44 g, 93 %).

**Biological Data**

The compounds of the invention inhibit the serine/threonine kinase activity of the aurora2 kinase and thus inhibit the cell cycle and cell proliferation. These properties may be assessed,

25 for example, using one or more of the procedures set out below:

**(a) In Vitro aurora2 kinase inhibition test**

This assay determines the ability of a test compound to inhibit serine/threonine kinase activity. DNA encoding aurora2 may be obtained by total gene synthesis or by cloning. This

30 DNA may then be expressed in a suitable expression system to obtain polypeptide with serine/threonine kinase activity. In the case of aurora2, the coding sequence was isolated from cDNA by polymerase chain reaction (PCR) and cloned into the BamHI and NotI restriction endonuclease sites of the baculovirus expression vector pFastBac HTc (GibcoBRL/Life

-228-

technologies). The 5' PCR primer contained a recognition sequence for the restriction endonuclease BamHI 5' to the aurora2 coding sequence. This allowed the insertion of the aurora2 gene in frame with the 6 histidine residues, spacer region and rTEV protease cleavage site encoded by the pFastBac HTc vector. The 3' PCR primer replaced the aurora2 stop codon with additional coding sequence followed by a stop codon and a recognition sequence for the restriction endonuclease NotI. This additional coding sequence (5' TAC CCA TAC GAT GTT CCA GAT TAC GCT TCT TAA 3') encoded for the polypeptide sequence YPYDVPDYAS. This sequence, derived from the influenza hemagglutinin protein, is frequently used as a tag epitope sequence that can be identified using specific monoclonal antibodies. The recombinant pFastBac vector therefore encoded for an N-terminally 6 his tagged, C terminally influenza hemagglutinin epitope tagged aurora2 protein. Details of the methods for the assembly of recombinant DNA molecules can be found in standard texts, for example Sambrook et al. 1989, Molecular Cloning - A Laboratory Manual, 2<sup>nd</sup> Edition, Cold Spring Harbor Laboratory press and Ausubel et al. 1999, Current Protocols in Molecular Biology, John Wiley and Sons Inc.

Production of recombinant virus can be performed following manufacturer's protocol from GibcoBRL. Briefly, the pFastBac-1 vector carrying the aurora2 gene was transformed into E. coli DH10Bac cells containing the baculovirus genome (bacmid DNA) and via a transposition event in the cells, a region of the pFastBac vector containing gentamycin resistance gene and the aurora2 gene including the baculovirus polyhedrin promoter was transposed directly into the bacmid DNA. By selection on gentamycin, kanamycin, tetracycline and X-gal, resultant white colonies should contain recombinant bacmid DNA encoding aurora2. Bacmid DNA was extracted from a small scale culture of several DH10Bac white colonies and transfected into Spodoptera frugiperda Sf21 cells grown in TC100 medium (GibcoBRL) containing 10% serum using CellFECTIN reagent (GibcoBRL) following manufacturer's instructions. Virus particles were harvested by collecting cell culture medium 72 hrs post transfection. 0.5 mls of medium was used to infect 100 ml suspension culture of Sf21s containing  $1 \times 10^7$  cells/ml. Cell culture medium was harvested 48 hrs post infection and virus titre determined using a standard plaque assay procedure. Virus stocks were used to infect Sf9 and "High 5" cells at a multiplicity of infection (MOI) of 3 to ascertain expression of recombinant aurora2 protein.

For the large scale expression of aurora2 kinase activity, Sf21 insect cells were grown at 28°C in TC100 medium supplemented with 10% foetal calf serum (Viralex) and 0.2% F68

Pluronic (Sigma) on a Wheaton roller rig at 3 r.p.m. When the cell density reached  $1.2 \times 10^6$  cells  $\text{ml}^{-1}$  they were infected with plaque-pure aurora2 recombinant virus at a multiplicity of infection of 1 and harvested 48 hours later. All subsequent purification steps were performed at  $4^\circ\text{C}$ . Frozen insect cell pellets containing a total of  $2.0 \times 10^8$  cells were thawed and diluted  
5 with lysis buffer (25 mM HEPES (N-[2-hydroxyethyl]piperazine-N'-[2-ethanesulphonic acid]) pH7.4 at  $4^\circ\text{C}$ , 100 mM KCl, 25 mM NaF, 1 mM  $\text{Na}_3\text{VO}_4$ , 1 mM PMSF (phenylmethylsulphonyl fluoride), 2 mM 2-mercaptoethanol, 2 mM imidazole, 1  $\mu\text{g}/\text{ml}$  aprotinin, 1  $\mu\text{g}/\text{ml}$  pepstatin, 1  $\mu\text{g}/\text{ml}$  leupeptin), using 1.0 ml per  $3 \times 10^7$  cells. Lysis was achieved using a dounce homogeniser, following which the lysate was centrifuged at 41,000g  
10 for 35 minutes. Aspirated supernatant was pumped onto a 5 mm diameter chromatography column containing 500  $\mu\text{l}$  Ni NTA (nitrilo-tri-acetic acid) agarose (Qiagen, product no. 30250) which had been equilibrated in lysis buffer. A baseline level of UV absorbance for the eluent was reached after washing the column with 12 ml of lysis buffer followed by 7 ml of wash buffer (25 mM HEPES pH7.4 at  $4^\circ\text{C}$ , 100 mM KCl, 20 mM imidazole, 2 mM 2-  
15 mercaptoethanol). Bound aurora2 protein was eluted from the column using elution buffer (25 mM HEPES pH7.4 at  $4^\circ\text{C}$ , 100 mM KCl, 400 mM imidazole, 2 mM 2-mercaptoethanol). An elution fraction (2.5 ml) corresponding to the peak in UV absorbance was collected. The elution fraction, containing active aurora2 kinase, was dialysed exhaustively against dialysis buffer (25 mM HEPES pH7.4 at  $4^\circ\text{C}$ , 45% glycerol (v/v), 100 mM KCl, 0.25% Nonidet P40  
20 (v/v), 1 mM dithiothreitol).

Each new batch of aurora2 enzyme was titrated in the assay by dilution with enzyme diluent (25mM Tris-HCl pH7.5, 12.5mM KCl, 0.6mM DTT). For a typical batch, stock enzyme is diluted 1 in 666 with enzyme diluent & 20 $\mu\text{l}$  of dilute enzyme is used for each assay well. Test compounds (at 10mM in dimethylsulphoxide (DMSO)) were diluted with  
25 water & 10 $\mu\text{l}$  of diluted compound was transferred to wells in the assay plates. "Total" & "blank" control wells contained 2.5% DMSO instead of compound. Twenty microlitres of freshly diluted enzyme was added to all wells, apart from "blank" wells. Twenty microlitres of enzyme diluent was added to "blank" wells. Twenty microlitres of reaction mix (25mM Tris-HCl, 78.4mM KCl, 2.5mM NaF, 0.6mM dithiothreitol, 6.25mM  $\text{MnCl}_2$ , 6.25mM ATP,  
30 7.5 $\mu\text{M}$  peptide substrate [biotin-LRRWSLGLRRWSLGLRRWSLGLRRWSLG]) containing 0.2 $\mu\text{Ci}$  [ $\gamma^{33}\text{P}$ ]ATP (Amersham Pharmacia, specific activity  $\geq 2500\text{Ci}/\text{mmol}$ ) was then added to all test wells to start the reaction. The plates were incubated at room temperature for 60

-230-

minutes. To stop the reaction 100µl 20% v/v orthophosphoric acid was added to all wells. The peptide substrate was captured on positively-charged nitrocellulose P30 filtermat (Whatman) using a 96-well plate harvester (TomTek) & then assayed for incorporation of <sup>33</sup>P with a Beta plate counter. "Blank" (no enzyme) and "total" (no compound) control values were used to  
5 determine the dilution range of test compound which gave 50% inhibition of enzyme activity. In this test, compound 52 in Table 2 gave 50% inhibition of enzyme activity at a concentration of 0.167µM, and Compound 253 in Table 21 gave 50% inhibition of enzyme activity at 0.089µM.

10 (a) **In Vitro cell proliferation assay**

This assay determines the ability of a test compound to inhibit the growth of adherent mammalian cell lines, for example the human tumour cell line MCF7. MCF-7 (ATCC HTB-22) or other adherent cells were typically seeded at  $1 \times 10^3$  cells per well (excluding the peripheral wells) in DMEM (Sigma Aldrich) without phenol red, plus 10%  
15 foetal calf serum, 1% L-glutamine and 1% penicillin/streptomycin in 96 well tissue culture treated clear plates (Costar). The following day (day 1), the media was removed from a no treatment control plate and the plate stored at -80°C. The remaining plates were dosed with compound (diluted from 10mM stock in DMSO using DMEM (without phenol red, 10% FCS, 1% L-glutamine, 1% penicillin/streptomycin). Untreated control wells were included on each  
20 plate. After 3 days in the presence / absence of compound (day 4) the media was removed and the plates stored at -80°C. Twenty four hours later the plates were thawed at room temperature and cell density determined using the CyQUANT cell proliferation assay kit (c-7026/c-7027 Molecular Probes Inc.) according to manufacturers directions. Briefly, 200µl of a cell lysis / dye mixture (10µl of 20X cell lysis buffer B, 190µl of sterile water, 0.25µl of  
25 CYQUANT GR dye) was added to each well and the plates incubated at room temperature for 5 minutes in the dark. The fluorescence of the wells was then measured using a fluorescence microplate reader (gain 70, 2 reads per well, 1 cycle with excitation 485nm and emission 530nm using a CytoFluor plate reader (PerSeptive Biosystems Inc.)). The values from day 1 and day 4 (compound treated) together with the values from the untreated cells were used to  
30 determine the dilution range of a test compound that gave 50% inhibition of cell proliferation. Compound 52 in Table 2 was effective in this test at 0.616µM and Compound 253 in Table 20 was effective at 5.9µM.

-231-

These values could also be used to calculate the dilution range of a test compound at which the cell density dropped below the day 1 control value. This indicates the cytotoxicity of the compound.

5 (a) In Vitro cell cycle analysis assay

This assay determines the ability of a test compound to arrest cells in specific phases of the cell cycle. Many different mammalian cell lines could be used in this assay and MCF7 cells are included here as an example. MCF-7 cells were seeded at  $3 \times 10^5$  cells per T25 flask (Costar) in 5 ml DMEM (no phenol red 10% FCS, 1% L-glutamine 1% penicillin / streptomycin). Flasks were then incubated overnight in a humidified 37°C incubator with 5% CO<sub>2</sub>. The following day 1ml of DMEM (no phenol red 10% FCS, 1% L-glutamine 1% penicillin / streptomycin) carrying the appropriate concentration of test compound solubilised in DMSO was added to the flask. A no compound control treatments was also included (0.5% DMSO). The cells were then incubated for a defined time (usually 24 hours) with compound.

15 After this time the media was aspirated from the cells and they were washed with 5ml of prewarmed (37°C) sterile PBSA, then detached from the flask by brief incubation with trypsin and followed by resuspension in 10ml of 1% Bovine Serum Albumin (BSA, Sigma-Aldrich Co.) in sterile PBSA. The samples were then centrifuged at 2200rpm for 10 min. The supernatant was aspirated and the cell pellet was resuspended in 200µl of 0.1% (w/v) Tris sodium citrate, 0.0564% (w/v) NaCl, 0.03% (v/v) Nonidet NP40, [pH 7.6]. Propidium Iodide (Sigma Aldrich Co.) was added to 40µg/ml and RNAase A (Sigma Aldrich Co.) to 100µg/ml.

20 The cells were then incubated at 37°C for 30 minutes. The samples were centrifuged at 2200rpm for 10 min, the supernatant removed and the remaining pellet (nuclei) resuspended in 200µl of sterile PBSA. Each sample was then syringed 10 times using 21 gauge needle. The

25 samples were then transferred to LPS tubes and DNA content per cell analysed by Fluorescence activated cell sorting (FACS) using a FACScan flow cytometer (Becton Dickinson). Typically 25000 events were counted and recorded using CellQuest v1.1 software (Verity Software). Cell cycle distribution of the population was calculated using Modfit software (Verity Software) and expressed as percentage of cells in G0/G1, S and G2/M phases

30 of the cell cycle.

Treating MCF7 cells with 1µM Compound 52 in Table 2 for 24 hours produced the following changes in cell cycle distribution:

-232-

Treatment	% Cells in G2/M
DMSO (control)	9.27%
10 $\mu$ M Compound 52	>50%

 15 attached to 2 carbon atoms or a CH<sub>3</sub> group which is attached to a carbon atom may optionally  
 bear on each said CH<sub>2</sub> or CH<sub>3</sub> group a substituent selected from hydroxy, amino, C<sub>1-6</sub>alkoxy,  
*N*-C<sub>1-6</sub>alkylamino, *N,N*-(C<sub>1-6</sub>alkyl)<sub>2</sub>amino and heterocyclyl.

13. A method for inhibiting aurora 2 kinase in a warm blooded animal, such as man, in  
 20 need of such treatment, which comprises administering to said animal an effective amount of  
 a compound of formula (I), as defined in any one of Claims 7-12 or a pharmaceutically  
 acceptable salt, or an *in vivo* hydrolysable ester thereof.

14. A compound as in any one of Claims 7-12, for use in a method of treatment of the  
 25 human or animal body by therapy.

15. A pharmaceutical composition comprising a compound according to Claims 7-12 in  
 combination with a pharmaceutically acceptable carrier.

\* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance  
 "E" earlier application or patent but published on or after the international filing date  
 "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)  
 "O" document referring to an oral disclosure, use, exhibition or other means  
 "P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance: the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance: the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/SE01/01450

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 2, 4, 13 and 16  
because they relate to subject matter not required to be searched by this Authority, namely:  
see next sheet
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.  
☐ No protest accompanied the payment of additional search fees.

INTERNATIONAL SEARCH REPORT

Internat. application No.  
PCT/SE01/01450

Claims 2,4,13 and 16 relate to methods of treatment of the human or animal body by surgery or by therapy/ diagnostic methods practised on the human or animal body/Rule 39.1.(iv). Nevertheless, a search has been executed for these claims. The search has been based on the alleged effects of the compounds/compositions.
